

Video Scintillation.

Videotapes includes what is interest me as scintillation.

Scintillation is one type of image distortions caused by the propagation of visible light through unstable atmosphere. AMAZIIIIING!

A videoclip is a 2D representation of the 3D world and I like to creating a 2D images from a contaminated 2D format.

The term scintillation originally refers to a nuclear physical phenomenon used in scintillation counting.

It has also been used to describe the wave propagation in random media.

The first In dream. As if! Baby mag I will examine the scintillation in detail and explain:

How take an image registration plus fusion approach.

Finally i will demonstrate successful application of scintillation on real video clips. Im on writings of my current results and experience around 2 years..

The people approach search to correct the image to model the atmosphere and the change of light path and compensate for that.

In my focus, I don't take such physics based approach.
