## **Instant obscura camera night update 1.**

**I had not gone further in thinking about the composition of the future series of photographs, since I had to study and this was the technical part of the process.**

**But now, the artistic part goes to show the chemistry, so oh I just had an idea really amazing and quite achievable with a material already acquired which it lacks only adaptation rings and a new battery.**

**I think, if it works, (and it seems like it should) I would be as surprised as super excited.**

**The approach of all analog photography techniques by the obscura room learning (data, calculations, works, results) pinhole data , and other elements, used in coupling with Optical Astronomy that I have been touching for a very short time is as difficult as it is easy, priceless maybe.**

**Difficult to explain but the results will be sufficient to realize I hope.**

**Here, few pics of obscura box i have do+used.**

**During my research, I understood that the box that i conceive to realize the photographs must be really a element which will allow an easy use, and, it is to build the same for my projects, explained in the blog, more sturdy, which will be used in conjunction with sky observation instruments and in which the elements will be maintained in the time.**

**The obscure box used for the tests was not strong even if it was of good quality and obligation to make the process with a material that can be painted and cut to reserve it as a cutting model in continuation!**
