

Like a Dialectical Plan: Epistemology is a field of philosophy which can refer to two fields of study: the critical study of science and scientific knowledge. The study of knowledge in general.

My project is mainly interested in epistemology as a study of sciences and scientific activities in order to train the scientific-mind (at my level) With simple means but in reality,

Behind: it is a set of data that I manage to share in a short time while having come to understand it and while having the possibility of extending the subject much more.

I would like to do workshops as part of educating, informing about Astronomy for development which I find to be an amazing subject (and context) which is absolutely related to what is written above.

The steps take turns in PDF formats, images, short videos: all interlock on a logical order.

These are based on Astronomy for Development and begin by taking up the stages of understanding one by one.

Then to transmit them in several ways that I took care to analyze.

I will share (later today) another part of what I just wrote. As explained

Extract of what's to come.

Ps: My classes are currently and shortly paused until May except The spectroscopy-class-in-progress because of an enormous bunch of pieces that I was forced to organise at the best for my complaint, but, all is ongoing and I got to organize my activities until October 2021 included!
