Experiment with the visible spectrum via photographic tests 2.

Experimental Sciences.

During the month of March, research is completed on:

Technical couplings video-photographs =) about coupling + many notions.

The module, in technique, is a prime element necessarily chosen as major element, according to which all the other parts will be determined from coefficients applied to this module.

Coupling at least two methods:

Two modules are said to be coupled if the change of one variable in one requests a change of the other.

I will meet Lomography-Paris team again in the frame of the Lo-fi workshops, April 7th. It will be dedicated to Diana F.

For more, Diana F will be one of the first used in coupling during my own experimental tests & if i'm right, it will out strangely cool and interesting.

I will write more technical details and results.

**There will probably be one or more writings by Lomography online,
in the magazine section. =)**
